The eurostat package R tools to access open data from Eurostat database

Search and download

Data in the Eurostat database is stored in tables. Each table has an identifier, a short table_code, and a description (e.g. *tsdtr420* - People killed in road accidents).

Key eurostat functions allow to find the table_code, download the eurostat table and polish labels in the table.

Find the table code

The **search_eurostat(pattern, ...)** function scans the directory of Eurostat tables and returns codes and descriptions of tables that match pattern.

```
library("eurostat")
query <- search_eurostat("road", type = "table")
query[1:3,1:2]
## title code
## 1 Goods transport by road ttr00005
## 2 People killed in road accidents tsdtr420
## 3 Enterprises with broadband access tin00090</pre>
```

Download the table

The get_eurostat(id, time_format = "date", filters = "none", type = "code", cache = TRUE, ...) function downloads the requested table from the Eurostat bulk download facility or from The Eurostat Web Services JSON API (if filters are defined). Downloaded data is cached (if cache=TRUE). Additional arguments define how to read the time column (time_format) and if table dimensions shall be kept as codes or converted to labels (type).

dat <- get_eurostat(id="tsdtr420", time_format="num") head(dat)</pre>

##		unit	sex	geo	time	values
##	1	NR	Т	AT	1999	1079
##	2	NR	Т	BE	1999	1397
##	3	NR	Т	CZ	1999	1455
##	4	NR	Т	DK	1999	514
##	5	NR	Т	EL	1999	2116
##	6	NR	Т	ES	1999	5738

Add labels

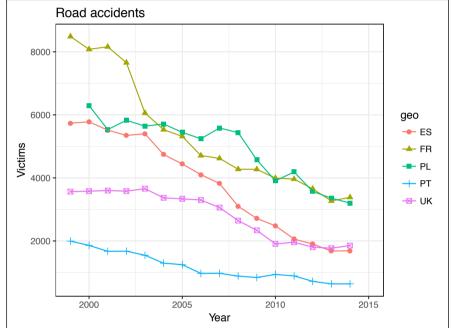

The label_eurostat(x, lang = "en", ...) gets definitions for Eurostat codes and replace them with labels in given language ("en", "fr" or "de").

dat <- label_eurostat(dat) head(dat)</pre>

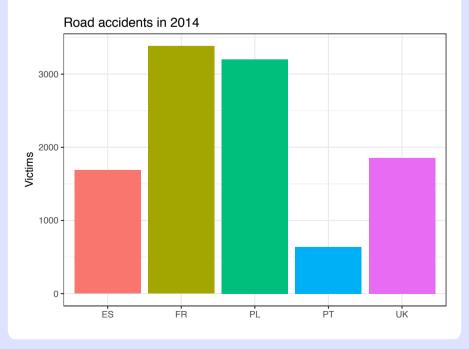

neaa(aat)												
##		unit	sex		geo	time	values					
##	1	Number	Total		Austria	1999	1079					
##	2	Number	Total		Belgium	1999	1397					
##	3	Number	Total	Czech	Republic	1999	1455					
##	4	Number	Total		Denmark	1999	514					
##	5	Number	Total		Greece	1999	2116					
##	6	Number	Total		Spain	1999	5738					

eurostat and plots

The **get_eurostat()** function returns tibbles in the long format. Packages **dplyr** and **tidyr** are well suited to transform these objects. The **ggplot2** package is well suited to plot these objects.

```
library("dplyr")
t2 <- t1 %>% filter(time == "2014-01-01")
ggplot(t2, aes(geo, values, fill=geo)) +
  geom_bar(stat = "identity") + theme_bw() +
  theme(legend.position = "none")+
  labs(title="Road accidents in 2014", x="", y="Victims")
```

eurostat and maps

Fetch and process data

There are three function to work with geospatial data from GISCO. The **get_eurostat_geospatial()** returns preprocessed spatial data as sp-objects or as data frames. The **merge_eurostat_geospatial()** both downloads and merges the geospatial data with a preloaded tabular data. The **cut_to_classes()** is a wrapper for **cut()** - function and is used for categorizing data for maps with tidy labels.

```
library("eurostat")
library("dplyr")
```

```
fertility <- get_eurostat("demo_r_frate3") %>%
  filter(time == "2014-01-01") %>%
  mutate(cat = cut_to_classes(values, n=7, decimals=1))
```

head(select(mapdata,geo,values,cat,long,lat,order,id)) aeo values cat lona ## 1 AT124 1.39 1.3 ~< 1.5 15.54245 48.90770 1.39 1.3 ~< 1.5 15.75363 48.85218 215 10 ## 3 AT124 1.39 1.3 ~< 1.5 15.88763 48.78511 216 10 1.39 1.3 ~< 1.5 15.81535 48.69270 217 10 1.39 1.3 ~< 1.5 15.94094 48.67173 218 10 1.39 1.3 ~< 1.5 15.90833 48.59815 ## 6 AT124 219 10

Draw a cartogram

The object returned by **merge_eurostat_geospatial()** are ready to be plotted with ggplot2 package. The **coord_map()** function is useful to set the projection while **labs()** adds annotations o the plot.
